

Basic Fan & Filter Assembly:

Technical / Installation

How do I install a flange?

To install the flange to the filter- take the flange and gasket tape with screws included out of the package, fasten the foam gasket tape to the underside of the flange by removing the sticky tape. The tape will fit around the circumference of the bottom of the flange closer to the inside edge. Once the gasket tape is installed, center the flange on top of the filter. Use the 6 teck screws to fasten the flange to the top of the filter in a star pattern. Be sure not to torque the screws too much as air will pass through the gaps.
